Automatic Car Identification

Automatic Car Identification was developed by KarTrak in the 1960s. It was capable of reading and transmitting the reporting marks of cars traveling in trains at up to 80 miles per hour. Each car had to carry a label with thirteen colored, reflective stripes which were read from the bottom to top. There was a corresponding color combination for each digit from 0 to 9 as shown below. For the purposes of visual reading, only the second through eleventh stripes from the bottom are relevant. These ten stripes should be reduced to ten digits. The first four relate to the car initials and the last six are simply the car number. Remember, the label is read from bottom to top! The following pages allow the first four digits to be translated into initials. Note that railroad intials are in the 0000 to 0999 range and private initials are in the 1000 to 1999 range. Also, some numerical combinations were reused after the original initials became obsolete.

ARR member railroads agreed in 1967 that all cars should be equipped with labels by January 1, 1970. This was later extended to June 1, 1970. Ultimately, there were problems with reliability and labels were no longer required after about February, 1978. Although many cars owners immediately stopped applying labels, others persisted into the early 1980s.

After ACI labels were no longer in use, cars often retained their original label after they were relettered. This allows their previous identity to be readily determined, even from photographs. Painting over the label wasn't always effective either as the paint over the stripes sometimes peeled off.
